WR35SL – GTR SHIFT LIGHT WIRING INFORMATION

WR35SL Shift light assembly requires 3 x connections to the M107 ECU Connector. While all three connectors look similar externally the right connector can be identified by the number of wires being used and also colors as highlighted in our wiring diagram.

All three shift light wires – power (+12V ignition switched), ground (0V) and Tach signal can be clearly seen here and are to be tapped into the existing wiring. Please take care when performing this installation.
